

CASE STUDY

Moving a 140 GB archive with **zero data loss**

27,000 media files. Same domain. Sub-
200ms page loads.

SWIPE →

THE SITUATION

27,000 files.
140 GB.

Carpentersville Area Memories is a community history archive that had **outgrown its old host**. The media library kept growing and the bill kept climbing.

LESSON 1

Add storage, not a server.

When your media outpaces your disk, a **dedicated storage volume** expands capacity without paying for a bigger server you don't need.

LESSON 2

Clean up the thumbnails.

Years of unused image sizes pile up quietly. Automated cleanup **reclaimed** **35 GB** without touching anything members can see.

LESSON 3

Migrate without the downtime.

A plugin-based transfer moved everything over encrypted cloud storage. No FTP, no SSH, **same domain and email routing intact**.

THE RESULT

"The site is super fast and I am saving a bunch of \$\$ making this change. Couldn't be happier."

Chuck Engels
